

WellTrack+ Privacy Policy Overview

Effective Date: May 2025

Introduction

WellTrack+ is a mobile health application that gives you a central and secure place to view and manage your personal health and wellness data. The app consolidates a wide range of health information—from physical activity and sleep metrics to medication reminders and emotional well-being logs—into a single, user-friendly platform. WellTrack+ was developed with privacy in mind from the start, providing clear and customizable controls to help you decide how your information is stored, used, and shared.

Privacy by Design

Our privacy approach is rooted in four core principles: **data minimization**, **on-device processing**, **transparency and control**, and **strong security**. These principles guide every feature in WellTrack+.

- **Data Minimization:** WellTrack+ is designed to minimize the health data stored on external servers. Most metrics and visualizations are generated directly on your device.
 - **On-Device Processing:** Key insights—such as sleep summaries, trend graphs, and cycle predictions—are processed locally on your phone or connected device, not in the cloud.
 - **Transparency & Control:** You control what data you log, what you share, and who you share it with.
 - **Security:** All data is encrypted while stored and during transmission. Only you and those you authorize can access your data.
-

End-to-End Encryption

All data managed through WellTrack+ is encrypted on your device and, if you choose to sync across devices using cloud services, it is end-to-end encrypted. This means that no one—not even WellTrack+ developers—can read your synced data. You must authenticate via a device passcode or biometric method (e.g., Face ID or fingerprint) to access the app.

Syncing Your WellTrack+ Data

If you enable syncing across devices, WellTrack+ health data is encrypted end-to-end using secure protocols. This ensures that your most up-to-date health metrics are available across your devices while protecting them from unauthorized access.

You may disable syncing at any time in your device's system or WellTrack+ privacy settings.

Third-Party App Controls

WellTrack+ only shares health data with third-party apps or services when you explicitly give permission. Apps or devices that want to access your WellTrack+ data must request your consent for each specific data type (e.g., step count, sleep duration, or medication history).

You can choose what data is shared and revoke permissions at any time. Apps denied access cannot detect which data types are unavailable, thus preventing any inference about your health status.

Developer and Partner Requirements

Apps and services that integrate with WellTrack+ must comply with our privacy and health data usage guidelines. They are required to explain why they are requesting specific types of health data and how it will be used. These apps are strictly prohibited from using your health data for advertising, profiling, or selling to data brokers.

On-Device Metrics and Computation

WellTrack+ uses sensor data from your phone or wearable devices to calculate health metrics locally. For instance, movement sensors calculate step counts and sleep detection without transmitting raw data to our servers.

Users can adjust or disable these computations through the app's settings. Options include toggling whether wrist temperature, heart rate, or physical movement data contributes to trend graphs or predictions like sleep scores or menstrual cycle forecasts.

Health Records

WellTrack+ allows users to import and view electronic health records from supported healthcare institutions. These records are retrieved through encrypted, direct connections to authorized

medical systems. Data is not routed through WellTrack+ servers, nor does WellTrack+ store decryption keys.

All analysis of health record content, including laboratory results or images, is performed on-device. You can disconnect and delete imported health records at any time.

Sharing with Family, Caregivers, or Providers

Users can optionally share selected health data with trusted individuals such as caregivers, partners, or healthcare providers. All shared data remains encrypted so that only the intended recipient can view it.

You can customize what is shared (e.g., high heart rate alerts, medication adherence) and stop sharing at any time. Revoking sharing will remove shared data from the recipient's device.

Data Use for Product Improvement

You may opt-in to share de-identified data with WellTrack+ developers to help improve app features. This data does not contain your name, account information, or other identifying characteristics and is not tied to your user profile. No health data is shared with developers unless you explicitly consent to it.
