

WellTrack+

Privacy Policy Overview

Effective Date: May 2025

Introduction

The Health app makes it easy for you to access your health and fitness information and provides you with meaningful insights to live a healthier life. It brings together over 150 different types of health data from your Phone, authorized third-party apps and devices, and connected healthcare providers. WellTrack+ securely stores your health and fitness information and lets you control each health data type read from and written to the Health app.

As people live more of their lives online, they're sharing more personal data than ever. The proliferation of data has been accompanied by a dramatic rise in attacks on data. The overwhelming majority of breaches involve sensitive personal information.

Nothing is more personal than your health information, so we built the WellTrack+ with privacy in mind from the beginning. WellTrack+ builds software that protects this data and puts you in control of which data is stored in the Health app and which data is shared with third-party apps and people you trust.

Privacy by Design

WellTrack+ is built on a foundation of four core privacy principles: data minimization, on-device processing, transparency and control, and security. Each of these principles is embedded into the app's architecture, ensuring robust privacy protections are implemented at every stage of data handling.

Data Minimization

WellTrack+ adheres to strict data minimization practices by reducing the amount of data transmitted to central servers. Health metrics are calculated and stored directly on the user's device. Users with two-factor authentication, a device passcode, and a supported operating system benefit from full end-to-end encryption, ensuring that health data cannot be accessed by anyone — not even WellTrack+. Only the minimum data necessary to provide functionality is used, and no health-related information is collected for marketing or advertising purposes.

On-Device Processing

Key health insights, such as Trends & Highlights, resting heart rate metrics, and Cycle Tracking predictions, are derived using on-device machine learning and data analysis. This design limits data exposure and eliminates the need to transmit raw health data externally. Examples of data

processed locally include step count derived from accelerometer data, heart rate variability from wearable sensors, and ovulation predictions based on wrist temperature. WellTrack+ ensures this analysis never leaves the user's device unless explicitly authorized.

Transparency and Control

Given the sensitive nature of health data, WellTrack+ offers granular controls over data sharing. Users can monitor and manage access through the Sharing tab. When third-party applications request access to data through the WellTrack+ API, users are presented with a detailed explanation of the request and can choose to approve or deny access to each specific data category. Users can view current permissions, revoke access, or delete data shared with any party, at any time, from within the app's Privacy & Security settings.

Security

All health and fitness data is protected with encryption both at rest and in transit. Devices secured with a passcode ensure data remains inaccessible to unauthorized users. WellTrack+ uses secure protocols for communication, and data is synced across devices using encrypted channels. Users can also enhance their privacy settings with biometric authentication, such as fingerprint or facial recognition.

End-to-End Encryption

WellTrack+ employs end-to-end encryption for all health data stored on-device and synced via cloud services. Only trusted devices authenticated with the user's account credentials and passcode can decrypt the data. Features like Medical ID remain accessible from the lock screen for emergency situations, but all other health data remains encrypted and inaccessible without authentication.

Syncing Your WellTrack+ Data

Data synchronization across multiple devices via the cloud is performed using secure end-to-end encryption. The synchronized data cannot be read by WellTrack+ or any intermediary. Users may manage sync preferences under Settings > Account > Cloud Sync > Health and may opt out at any time, ensuring complete control over where their health data resides.

Third-Party App Controls

WellTrack+ only shares user data with third-party apps when users explicitly grant permission. Access must be requested through the WellTrack+ API, with each data type requiring individual consent. By default, no data access is granted, and apps cannot infer which data exists if permission is denied. This design prevents apps from deducing a user's health conditions based on access patterns. If access is revoked, third-party apps immediately lose visibility into WellTrack+ data.

Requirements for Apps Using WellTrack+ API

Third-party applications that wish to access WellTrack+ data must comply with the WellTrack+ Developer Guidelines and License Agreement. Access is restricted to applications that provide legitimate health or fitness services. Each app must clearly state the purpose of data access and is prohibited from using the data for advertising, profiling, or resale. A comprehensive privacy policy is required, and the app must allow users to revoke consent and request data deletion.

On-Device Metrics and Computation

WellTrack+ minimizes central storage of sensitive data. Metrics such as active energy, sleep analysis, and motion trends are computed using data from on-device sensors like gyroscopes, accelerometers, and heart rate monitors. Users can enable or disable data computation features through device settings. For example, iOS users can disable Fitness Tracking in Settings > Privacy & Security > Motion & Fitness, and control watch-based sensor inputs via Settings in the companion app.

Health Records

WellTrack+ enables users to connect to healthcare providers and securely import medical records. These records are retrieved using encrypted connections directly between the user's device and the provider's electronic health record system. WellTrack+ never routes this data through its servers and does not possess the encryption keys used in transmission. Users can disconnect a provider and erase associated records at any time.

Health Sharing

Users may choose to share health data with trusted family members or caregivers through the Sharing tab. Up to five individuals may be authorized, and users control the scope and duration of data sharing. Shared data is encrypted, and only recipients with verified credentials can access it. If sharing is discontinued, access is immediately revoked, and the shared data is deleted from recipient devices.

Sharing with Healthcare Providers

WellTrack+ supports secure data sharing with healthcare providers. This feature enables users to transmit relevant health metrics directly to their clinicians. All transmitted data is protected with end-to-end encryption. Providers can only view shared data for the duration of the user's

consent. Revoking access removes the data from the provider's view and deletes the transmission channel.

Improve Health & Activity

Users who opt-in may contribute de-identified data to help WellTrack+ enhance its analytics and features. Only aggregated, anonymized data is used, and it is never linked to a user account. All computations for improvement metrics are performed on-device. Only when the user explicitly consents will summarized results be sent for product development purposes.

Conclusion

WellTrack+ is committed to providing powerful health insights while maintaining the highest standards of data privacy and user control. All personal health information is encrypted by default, and users determine how and with whom their data is shared. WellTrack+ processes health metrics locally to minimize exposure, ensures secure syncing across devices, and never accesses user data without explicit consent. This privacy-first approach ensures users can engage with their health data confidently and securely.
